Day 5: Chalkidiki

The region is characterized by a varied landscape, with mountains, coastal areas, and valleys. The geology of the region is complex, with a mix of metamorphic and igneous rocks. The primary rock types include gneiss, amphibolite, and ophiolites. The area is known for its karstic features, with a system of caves and sinkholes. The coastline is predominantly rocky, with cliffs and beaches.

Day 6: Near Mantem Pit

The Mantem Pit is a significant geological feature near the town of Platanou. It is a fault block that has been uplifted, creating a fault scarp. The fault scarp is a prominent landscape feature, with steep cliffs and a distinctive profile. The fault block contains a variety of rock types, including conglomerate and gneiss. The area is of interest for its geological and tectonic significance.

The text describes the geological and tectonic setting of the area, highlighting the importance of the fault scarp and the fault block. It also notes the presence of various rock types and the geological processes that have shaped the landscape. The text includes references to specific geological formations and structures, providing a detailed description of the region's geology.
